ECE 220 Computer Systems & Programming

Lecture 16 – File I/O

Input / Output Streams

scanf("%d", &x)

I/O Device operates using
I/O protocol (such as memory mapped I/O)

In C, we abstract away the I/O details to an I/O function call

Stream Abstraction for I/O

All character-based I/O in C is performed on **text streams**.

A stream is a **sequence of ASCII characters**, such as:

- the sequence of ASCII characters printed to the monitor by a single program
- the sequence of ASCII characters entered by the user during a single program
- the sequence of ASCII characters in a single file

Characters are processed in the order in which they were added to the stream.

 e.g., a program sees input characters in the same order as the user typed them.

Standard Streams:

Input (keyboard) is called stdin.

Output (monitor) is called **stdout**.

Error (monitor) is called **stderr**.

Buffering

 Every value that goes into the stream is captured by the low-level OS software and kept in a buffer (a small array)

Input Buffering

The buffer is released when the user presses **Enter key**.

Output Buffering

The buffer is released when the program submits a <u>newline character</u> ('\n')

Buffer allows to decouple the producer from the consumer.

Buffered Input

```
#include <stdio.h>
 2
    int main()
 4
   □ {
 5
      char inChar1;
      char inChar2;
 8
      printf("Input character 1:\n");
 9
      inChar1 = getchar();
10
11
      printf("Input character 2:\n");
12
      inChar2 = getchar();
13
14
      printf("Character 1 is %c\n", inChar1);
15
      printf("Character 2 is %c\n", inChar2);
16
```

Buffered output

```
#include <stdio.h>
    #include <unistd.h>
 3
    int main()
 5
   □ {
      putchar('a');
 6
 8
      sleep(5);
 9
10
      putchar('b');
      putchar('\n');
11
12 \\
```

```
#include <stdio.h>
#include <unistd.h>

int main()

putchar('a');
putchar('\n');

sleep(5);

putchar('b');
putchar('\n');

putchar('\n');
```

Basic I/O Functions

- Creating I/O streams
 - fopen: open/create a file for I/O
 - fclose: close a file for I/O
- I/O one character at a time
 - fgetc: Reads an ASCII character from stream
 - fputc: Writes an ASCII character to stream
 - getchar: Reads an ASCII character from the keyboard
 - putchar: Writes an ASCII character to the monitor
- I/O one line at a time
 - fgets: Reads a string (line) from stream
 - fputs: Writes a string (line) to stream
- Formatted I/O
 - fprintf: Writes a formatted string to stream
 - fscanf: Reads a formatted string to stream

Creating I/O stream

```
FILE* fopen(char* filename, char* mode) //mode: "r", "w", "a", ...
       success-> returns a pointer to FILE
       failure-> returns NULL
int fclose(FILE* stream)
       success-> returns 0
       failure-> returns EOF (Note: EOF is a macro, commonly -1)
                 FILE *myfile;
                 myfile = fopen("test.txt", "w");
                 if(myfile == NULL){
                     printf("Cannot open file for write.\n");
                     return -1:
                 fclose(myfile);
                 return 0:
```

I/O one character at a time

```
int fgetc(FILE* stream)
    success-> returns the next character
    failure-> returns EOF and sets end-of-file indicator

int fputc(int character, FILE* stream)
    success-> write the character to file and returns the character written
    failure-> returns EOF and sets end-of-file indicator
```

Write to a file using fputc()

```
#include <stdio.h>
    int main()
 3
   ₽ {
 4
         int c;
 5
         FILE *f;
 6
        /* write to file */
         f = fopen("out.txt", "w");
 8
         if (f == NULL)
 9
             printf("Unable to open file out.txt for writing\n");
10
11
             return -1;
12
13
         c = getchar();
         while (c != ' n')
14
15
16
             fputc(c, f);
             c = getchar();
17
18
19
         fclose(f);
```

```
/* read from file */
21
        if ((f = fopen("out.txt", "r")) == NULL)
22
23
24
            printf("Unable to open file out.txt for reading\n");
25
             return -1;
26
27
        c = fgetc(f);
        while (c != EOF) /* EOF is a macro defined in stdio.h */
28
29
30
            putchar(c);
31
            c = fgetc(f);
32
33
        putchar('\n');
34
        fclose(f);
        return 0;
35
36
```

I/O one line at a time: fgets, fputs

```
#include <stdio.h>
   pint main() {
      FILE *in, *out;
 4
 5
      char buf[5];
 6
      if((in=fopen("Text.txt","r"))==NULL) {
        printf("Unable to open input.\n");
 8
 9
        return -1;
10
11
      if((out=fopen("out2.txt","w"))==NULL) {
12
        printf("Unable to open output.");
13
        return -1;
14
15
      printf("%d\n", sizeof(buf));
16
17
18
      fgets(buf, sizeof(buf), in);
19
      while(!feof(in)) {
20
        fputs (buf, out);
21
        printf("%s\n", buf);
         fgets(buf, sizeof(buf), in);
22
23
24
25
      fclose(in);
26
      fclose (out);
27
28
      return 0;
29
```

```
/* File I/O Example */
#include <stdio.h>
int main(){
   FILE *file;
   char buffer[100];
   //
   file = fopen("intro.txt", "w");
   //
   printf("Write a self introduction with less than 100 characters: ");
   fgets(buffer, 100, stdin);
   //
   fputs("Your self introduction: ", file);
   fputs(buffer, file);
   fclose(file);
   //
   fputs(buffer, stdout);
   return 0;
                                                                        9
```

Formatted I/O

```
int fprintf(FILE* stream, const char* format, ...)
       success-> returns the number of characters written
       failure-> returns a negative number
int fscanf(FILE* stream, consta char* format, ...)
       success-> returns the number of items read; 0, if pattern doesn't match
       failure-> returns FOF
                                        #include <stdio.h>
                                       pint main() {
                                           int k;
                                           FILE* out;
                                           int array[100];
                                    6
                                           for (k=0; k<100; ++k) {
                                             array[k] = k;
                                           out = fopen("data.txt","w");
                                   10
                                   11
                                   12 占
                                           for (k=0; k<100; ++k) {
                                   13
                                             fprintf(out, "%d ", array[k]);
                                   14
                                   15
                                           fclose (out);
```

16

17

return 0;

Exercise: Read an mxn matrix from file in_matrix.txt and write its transpose to file out_matrix.txt. **The first row of the file specifies the size of the matrix.**

Hint: use fscanf to read from a file and use fprintf to write to a file.

```
#include <stdio.h>
int main() {
    FILE *in;
    FILE *out;

    //
    in_file = fopen("in_matrix.txt", "r");
    if(in == NULL)
        return -1;

    //
    int m, n;
    fscanf(in, "%d %d", &m, &n);
    int matrix[m][n];
```

23 123 456

out_matrix.txt

3 2

```
//
out_file = fopen("out_matrix.txt", "w");
if(out == NULL)
    return -1;
//
fprintf(out, "%d %d\n", n, m);
```

```
return 0;
```
